

The Kullback-Leibler divergence (KL divergence) between two probability distributions p and q is defined as

$$\mathbb{D}_{KL}(p\|q) = \mathbb{E}_{X \sim p} \left[\log \frac{p(X)}{q(X)} \right] = \sum_x p(x) \log \frac{p(x)}{q(x)}$$

There are various interpretations of the KL divergence in statistics, coding theory, and inference.
